

Rat Poison & Wildlife

Local residents may inadvertently be poisoning our wildlife by using anticoagulant rodenticides (rat poison).

1

Rodents Ingest

Rats and other rodents who eat the poison do not die immediately, but become lethargic and are easy prey for larger predators.

3 Top Predator

Bobcats are the top of the food chain on Kiawah. They feed on rodents and smaller predators that are infected with rat poison. This can result in their death.

2

Smaller Predators like hawks, foxes, and raccoons consume rodents infected with rat poison. This can result in their death.

CHECK THE LABEL!

Avoid using the following anticoagulant rodenticides:

Brodifacoum
Bromadiolone

Difenacoum
Difethialone
